TOYO INK'S COMMERCIAL SHEETFED FORMULATIONS PROVIDE TOTAL SOLUTION FOR QUALITY, VERSATILITY AND PERFORMANCE

ADDISON, Ill. — TOYO INK offers inks specially formulated to achieve the color-critical results needed for high-quality commercial applications. These inks provide faithful color reproduction and smooth ink transfer. TOYO INK has developed each to improve print quality and overall productivity.

HyPlus EC

The most popular process ink manufactured by TOYO INK provides strong contrast and high density, as well as maintaining low dot gain under a variety of screening applications. The result is dot fidelity, color intensity and excellent ink transfer. HyPlus EC sets quickly and dries well on most substrates to a very high gloss, yet stays open on press. The ink comes up to color quickly for shorter makereadies and reduced materials waste. It works equally well with ultraviolet (UV) and water-based coatings. HyPlus EC also enables fast work-and-turn and bindery processing.

HyUnity

Excellent contrast and high density are hallmarks of HyUnity ink. It dries to a very high gloss and boasts good rub resistance. It produces outstanding print quality on a very wide range of substrates. It features color and dot consistency batch-to-batch and reliable stay open property. There's less color variation with better matched reprints. HyUnity offers a wide water window and less gloss back.

HYLITE

HYLITE combines high efficiency and low cost for a major improvement in productivity. HYLITE features TOYO INK's acclaimed vehicle system that makes a wider water window and affords easy key control. Predictable runability on press and better matched reprints meet the printer's need for performance. HYLITE's customer-proven stay open property adds to cost savings.

TOYO INK will showcase its commercial high-quality sheetfed inks at PRINT 05, September 9-15 at Chicago's McCormick Place Complex.
